

Closures of Relations

关系闭包

Transitive closure传递闭包

Relational closures关系闭包

- We know that:
- a relation R on a non-empty set A may or may not have some special property such as “**Transitive**”.
- But for some purpose, we need a relation which is transitive and contains R as its subset.
- **Question**: how can we add some pairs to R to make R “a little bit bigger”, then it is transitive? What is that relation? Is it possible? Easy or hard?
- The same idea for other properties: **Reflexive** and **Symmetric**
- Introduction of the concept of relational closure...

Relational closures

- Three types of Closures we will study
 - Reflexive 自反闭包
 - Easy
 - Symmetric 对称闭包
 - Easy
 - Transitive 传递闭包
 - Hard

Definition 闭包定义

- R is a relation on a non-empty set A , R 可能不满足某种特性 “ P ” such as reflexive/transitive/symmetric.
- 定义：如果 $C(R)$ 是 A 上的包含 R 的满足特性 “ P ” 关系，而且如果还有其它的二元关系 S 也满足包含 R 且具有特性 “ P ” 的话，就有 $C(R) \subseteq S$.
- $C(R)$ is called as the closure of R with respect to the property “ P ”. 这样的 $C(R)$ 称作 R 关于性质 P 的关系闭包
- Actually, the closure $C(R)$ of R with respect to property “ P ” is the minimum relation containing R as a subset and satisfy the property “ P ”. 闭包也即最小的包含 R 且满足性质 “ P ” 的关系

Reflexive closure 自反闭包

- Consider a relation R :
 - Note that it is not reflexive
- Question: to make R reflexive, what should we do?

- We want to add edges to make the relation reflexive
- 添加边（实际上是添加序对）
- By adding those edges, we have made a non-reflexive relation R into a reflexive relation

- This new relation is called the **reflexive closure** of R

Reflexive closure 自反闭包公式

- 给每一个没有loop的节点添加loop，构造自反闭包
- The reflexive closure 自反闭包 of R is
 $R \cup I_A$, Where $I_A = \{ (a,a) \mid a \in A \}$
 - Called the “diagonal relation”
 - With matrices, we set the diagonal to all 1's

Closure--Example

- Let R be a relation on the set $\{0, 1, 2, 3\}$ containing the ordered pairs $(0,1)$, $(1,1)$, $(1,2)$, $(2,0)$, $(2,2)$, and $(3,0)$
- What is the reflexive closure of R ?
- We add all pairs of edges (a,a) that do not already exist

We add edges:
 $(0,0)$, $(3,3)$

Symmetric closure 对称闭包

- Consider a relation R :
 - Note that it is not symmetric (why?)
- Question: to make R symmetric, what should we do?
- We want to add edges to make the relation symmetric
- 添加 对称的边,
- By adding those edges, we have made a non-symmetric relation R into a symmetric relation

- This new relation is called the **symmetric closure** of R

Symmetric closure 对称闭包公式

- 添加双向边到所有存在单向边的地方
- The symmetric closure of R is $R \cup R^{-1}$
 - If $R = \{ (a,b) \mid \dots \}$
 - Then $R^{-1} = \{ (b,a) \mid \dots \}$

对称Closure--Example

- Let R be a relation on the set $\{0, 1, 2, 3\}$ containing the ordered pairs $(0,1)$, $(1,1)$, $(1,2)$, $(2,0)$, $(2,2)$, and $(3,0)$
- What is the symmetric closure of R ?
- We add all pairs of edges (a,b) where (b,a) exists
 - We make all “single” edges into anti-parallel pairs

We add edges:

$(0,2)$, $(0,3)$

$(1,0)$, $(2,1)$

问题

如何在给定的二元关系 R 的基础上，“适当扩大”直到获得其传递闭包？

Paths in directed graphs 有向图中的路

- A *path* is a sequences of connected edges from vertex a to vertex (结点) b

- No path exists from the noted start location

- A path that starts and ends at the same vertex is called a circuit or cycle

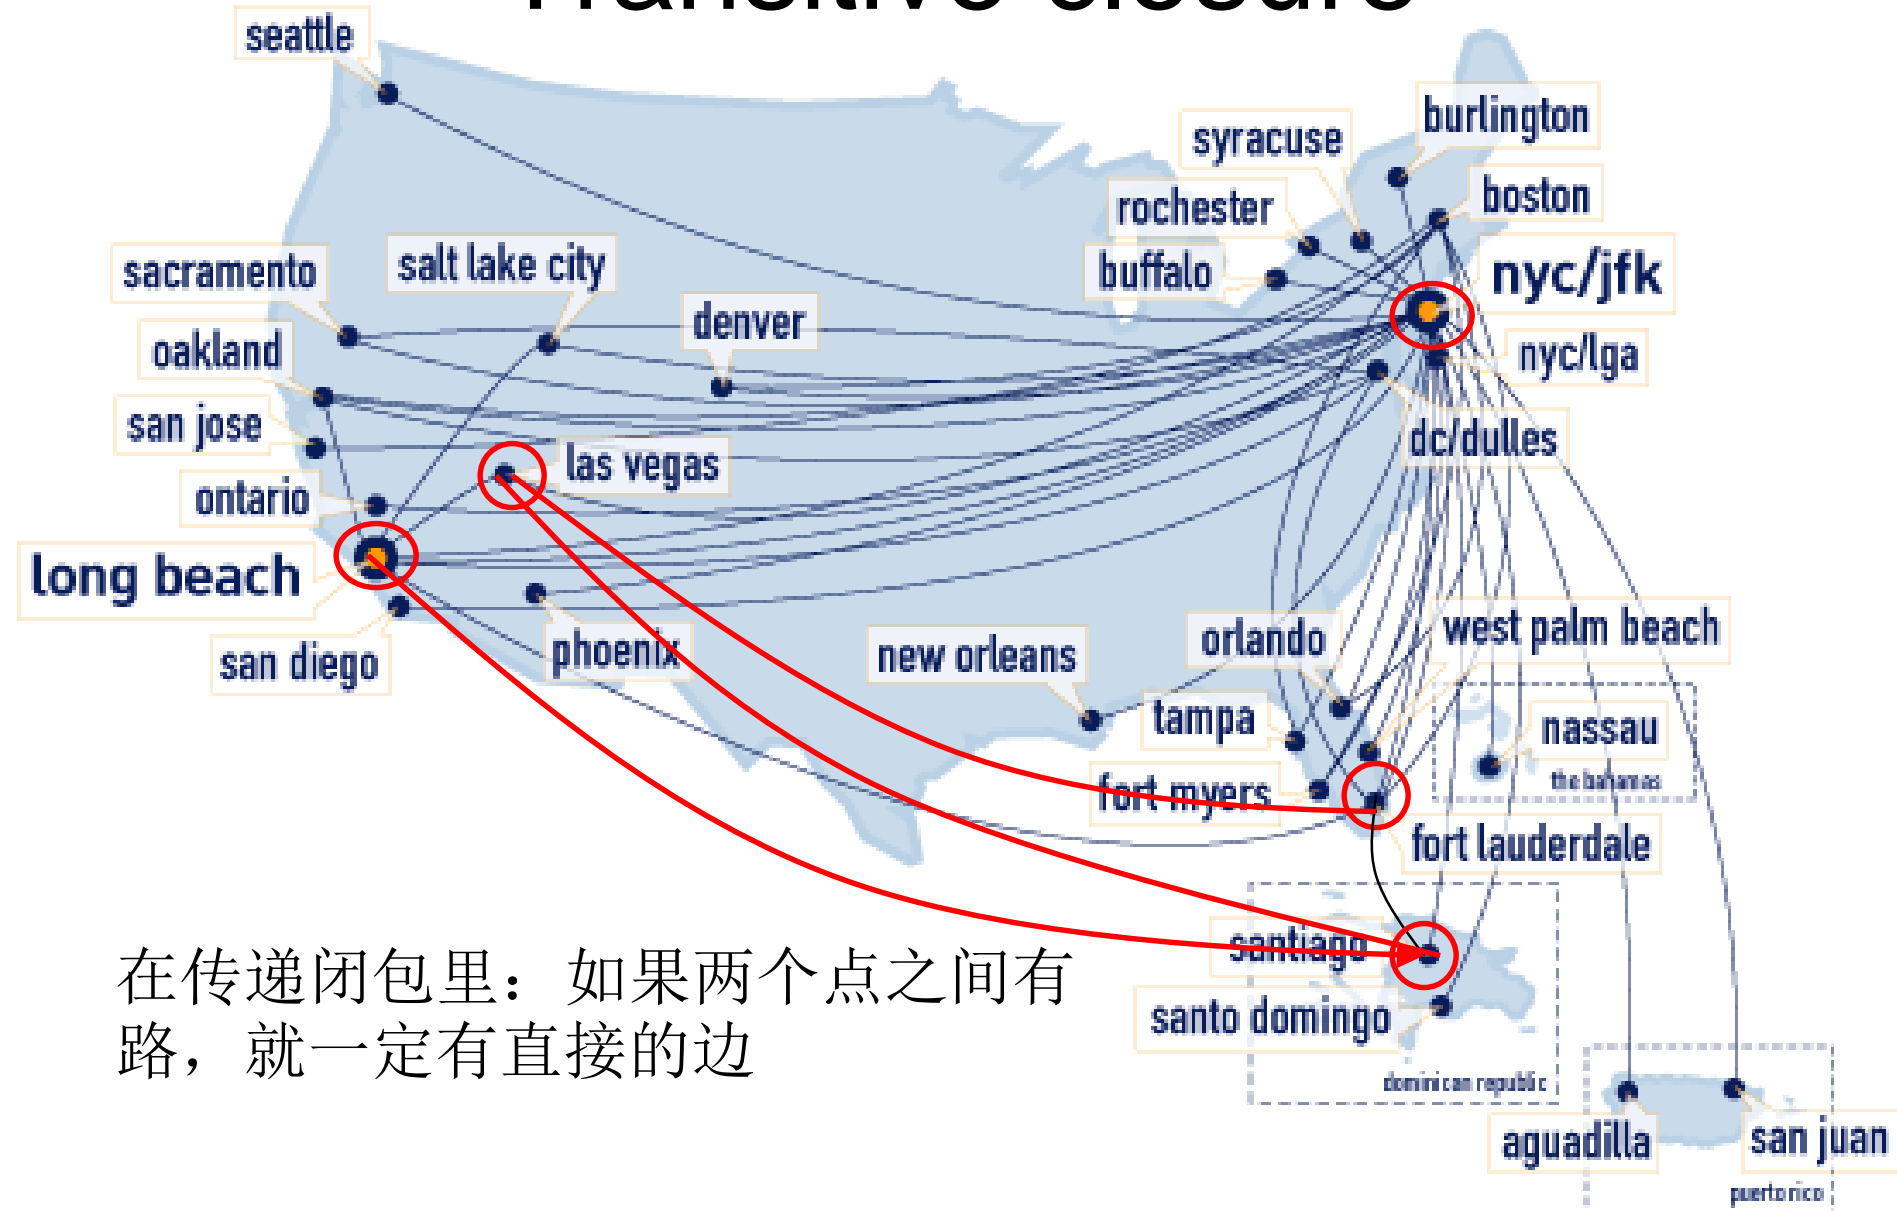

- Must have length ≥ 1

More on paths...

- The length of a path is the number of **edges** in the path, not the number of nodes （路长概念）
- *Note: “path” is a concept of graph theory, we will show much more detail in the chapter GRAPH*

Transitive closure

Finding Transitive closure 寻找传递闭包

- Informal definition: If there is a path from a to b , then there should be an edge from a to b in the transitive closure
- First take of a definition:
 - In order to find the transitive closure of a relation R , we add an edge from a to c , whenever there are edges from a to b and b to c
- But there is a path from 1 to 4 with no edge!

Transitive closure传递闭包

- 在传递闭包里面，如果有从点a到b的路，那么就一定有a到b的边
- Second take of a definition:
 - In order to find the transitive closure of a relation R , we add an edge from a to c , when there are edges from a to b and b to c
 - Repeat this step until no new edges are added to the relation
- We will study different algorithms for determining the transitive closure
- red means added on the first repeat
- teal means added on the second repeat

Transitive closure传递闭包

- **Formal definition:** R is a binary relation on a set A , the transitive closure of R is a new relation R^* which contains R , transitive, and for any transitive relation on A containing R is a superset of R^* .
- $R \subseteq R^*$, R^* is transitive; If S is a transitive relation such that $R \subseteq S$, then $R^* \subseteq S$
- The transitive closure of R is the **smallest** transitive relation on A which contains R as its subset.
传递闭包是包含 R 的可传递的最小的二元关系

Question 传递闭包存在性问题

- For any binary relation R on set A , is there transitive relation containing R ?
- Is there transitive closure for binary relation on set A ? Unique?

transitive closure传递闭包计算公式

- If R is a binary relation on non-empty set A , then the transitive closure of R is

$$R^* = \bigcup_{i=1}^{\infty} R^i$$

- If A is a finite set with n elements, then

$$R^* = \bigcup_{i=1}^n R^i$$

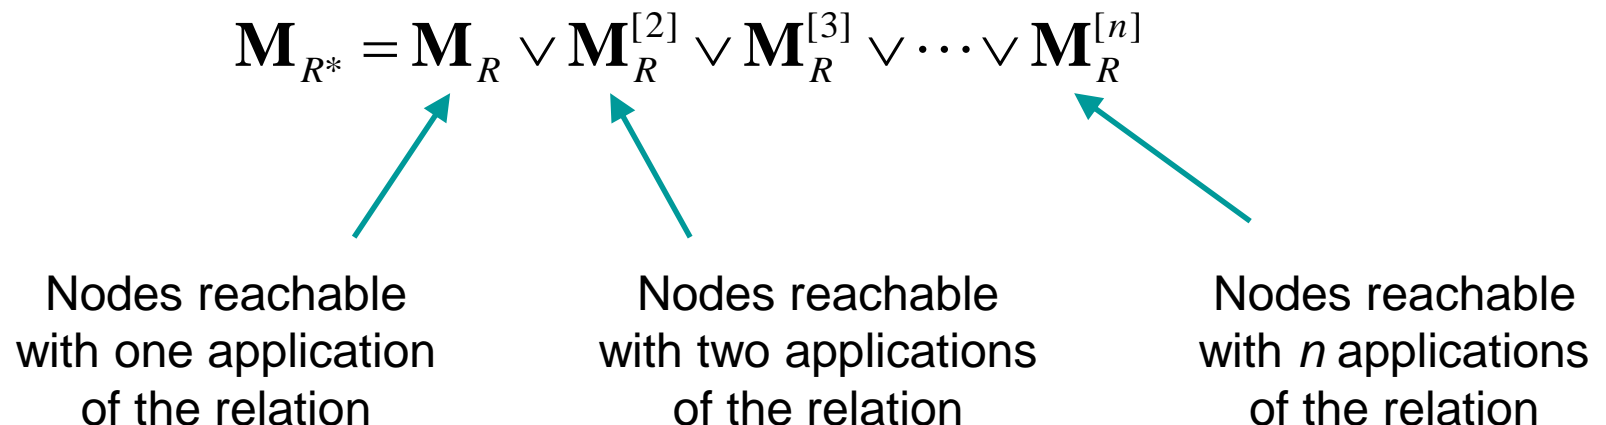

Think about why? Can you prove it is the minimum transitive relation including R as subset?

Finding the transitive closure

利用关系矩阵计算传递闭包

- **Theorem:** Let \mathbf{M}_R be the zero-one matrix of the relation R on a set A with n elements. Then the zero-one matrix of the transitive closure R^* is:

$$\mathbf{M}_{R^*} = \mathbf{M}_R \vee \mathbf{M}_R^{[2]} \vee \mathbf{M}_R^{[3]} \vee \cdots \vee \mathbf{M}_R^{[n]}$$

Nodes reachable
with one application
of the relation

Nodes reachable
with two applications
of the relation

Nodes reachable
with n applications
of the relation

Please think about the amount of computing of finding transitive closure..

Close--example

- Find the zero-one matrix of the transitive closure of the relation R given by:

$$\mathbf{M}_R = \begin{bmatrix} 1 & 0 & 1 \\ 0 & 1 & 0 \\ 1 & 1 & 0 \end{bmatrix}$$

$$\mathbf{M}_R^{[2]} =$$

$$\mathbf{M}_{R^*} = \mathbf{M}_R \vee \mathbf{M}_R^{[2]} \vee \mathbf{M}_R^{[3]}$$

$$\mathbf{M}_R^{[2]} = \mathbf{M}_R \odot \mathbf{M}_R = \begin{bmatrix} 1 & 0 & 1 \\ 0 & 1 & 0 \\ 1 & 1 & 0 \end{bmatrix} \odot \begin{bmatrix} 1 & 0 & 1 \\ 0 & 1 & 0 \\ 1 & 1 & 0 \end{bmatrix} = \begin{bmatrix} 1 & 1 & 1 \\ 0 & 1 & 0 \\ 1 & 1 & 1 \end{bmatrix}$$

Close--example

$$\mathbf{M}_R^{[3]} = \mathbf{M}_R^{[2]} \odot \mathbf{M}_R = \begin{bmatrix} 1 & 1 & 1 \\ 0 & 1 & 0 \\ 1 & 1 & 1 \end{bmatrix} \odot \begin{bmatrix} 1 & 0 & 1 \\ 0 & 1 & 0 \\ 1 & 1 & 0 \end{bmatrix} = \begin{bmatrix} 1 & 1 & 1 \\ 0 & 1 & 0 \\ 1 & 1 & 1 \end{bmatrix}$$

$$\mathbf{M}_{R^*} = \begin{bmatrix} 1 & 0 & 1 \\ 0 & 1 & 0 \\ 1 & 1 & 0 \end{bmatrix} \vee \begin{bmatrix} 1 & 1 & 1 \\ 0 & 1 & 0 \\ 1 & 1 & 1 \end{bmatrix} \vee \begin{bmatrix} 1 & 1 & 1 \\ 0 & 1 & 0 \\ 1 & 1 & 1 \end{bmatrix} = \begin{bmatrix} 1 & 1 & 1 \\ 0 & 1 & 0 \\ 1 & 1 & 1 \end{bmatrix}$$

Transitive closure algorithm 传递闭包算法

- What we did (or rather, could have done):
 - Compute the next matrix $\mathbf{M}_R^{[i]}$, where $1 \leq i \leq n$
 - Do a Boolean join with the previously computed matrix
- For our example:
 - Compute $\mathbf{M}_R^{[2]} = \mathbf{M}_R \circ \mathbf{M}_R$
 - Join that with \mathbf{M}_R to yield $\mathbf{M}_R \vee \mathbf{M}_R^{[2]}$
 - Compute $\mathbf{M}_R^{[3]} = \mathbf{M}_R^{[2]} \circ \mathbf{M}_R$
 - Join that with $\mathbf{M}_R \vee \mathbf{M}_R^{[2]}$ from above

Transitive closure algorithm

传递闭包算法伪代码

procedure *transitive_closure* (\mathbf{M}_R : zero-one $n \times n$ matrix)

A := \mathbf{M}_R

B := **A**

for $i := 2$ **to** n

begin

A := $\mathbf{A} \odot \mathbf{M}_R$

B := $\mathbf{B} \vee \mathbf{A}$

end { **B** is the zero-one matrix for R^* }

Warshall's algorithm经典的沃舍尔算法

- More efficient algorithms exist, such as Warshall's algorithm, which is famous
 - not going to teach it in this class
 - To learn it please see the textbook, and think about why Warshall's algorithm is good.
